

Project:

Bearbus workshop warehouse analysis

Analyzed:

258K transactions from a warehouse management software

Goal:

Identify material outbound delays and optimize storage locations

Count of TA-Number by first week

Count of TA-Nummer by Erst.Woche and Materialkurztext

Materialkurztext Dichtung Distanzbolzen Hebel Stützscheibe Zugfeder

Ordered VS actual Quantity

Sum of Processing time

Average of Processing time year, Quarter, Month and Day

Sum of Bearbeitungszeit by Erst.Wochentag

Sum of Bearbeitungszeit by Quit.Wochentag

Sum of Bearbeitungszeit by Materialkurztext

Average of Bearbeitungszeit by Materialkurztext

Deckplatte DPL 2-W3 hat die größte durchschnittliche Bearbeitungszeit

Material Outflow Delays → Data-driven Solutions

PROBLEM 1: Slow material access

Found: Seals/Levers/Tension springs = highest TA-Number frequency

Solution: Assigned to prime exit slots

PROBLEM 2: DPL 2-W3 processs bottleneck

Found: 190+hr avg processing time (177 TA-Number)

Solution: ETL/Power Query Analysis → Root Cause Investigation

PROBLEM 3: Weekend backlog

Found: Sunday orders → Monday 60+hr peaks (DAX analysis)

Solution: Implement prioritization rules
